JAMES TEELING

Product Manager | 0-to-1 Builder | AI Systems at Consumer Scale

SUMMARY

I build the thing nobody asked for, and it gets adopted. Affirmity had no work-management tool, so I built one and it became how the team ran projects. Product owners at American Airlines were losing 30 to 45 minutes an item to manual intake, so I built an agentic AI system that is now in production across the mobile org. On my own time I've shipped an iOS app to the App Store and a multi-agent research platform an M&A firm uses daily. My day job is consumer growth and consent surfaces on one of the largest airline apps in the US, the flows that took marketing opt-ins from 400K to 10.7M. I'm looking for a team where building it is the job, not the side project.

EXPERIENCE

**Product Manager, Mobile App** (previously Program Manager, Delivery Transformation)  
*American Airlines | Dallas, TX | Oct 2021 - Present*

Own the permission and consent surfaces of one of the largest airline apps in the US: push-notification opt-in mechanics, the app download screen, Airship marketing opt-in campaigns, and the Preference Center. Every flow that asks a customer to say yes.

- Turned an executive directive to grow marketing opt-ins into a shippable strategy. I broke it into incremental releases, moved the Preference Center into the app's More section so customers could actually reach it, and drove the legal and compliance review, screen design, and developer logic. Opt-ins grew from 400K to 10.7M, opening a customer base the company had never been able to market to, and one campaign off that audience generated \$15.6M.
- Designed a contextual opt-in card that appears on the Trips page when a customer has an upcoming flight but push is disabled at the device level, offering notifications at the one moment the value is self-evident. Running as a test on Trips first, then expanding to other flows based on the results.
- Built a Python pipeline that mines unstructured customer feedback for emerging themes and quantifies the demand behind each one, replacing gut-feel prioritization with evidence and eliminating recurring AI token costs.

**Project Manager, Vendor Management**

*Cotality (formerly CoreLogic) | Irving, TX | Jan 2020 - Oct 2021*

- Replaced manual vendor-contract reporting with a live SharePoint-linked dashboard, tripling contract visibility and reaching 87% adoption by embedding it into the contracting team's weekly workflow.

**Principal Data Engineer**

*Affirmity (formerly Peoplefluent) | Dallas, TX | Dec 2011 - Dec 2019*

- Built the team's work-management system from nothing because no tracking tool existed. Analysts updated a single date and everything else automated. It became how the team ran projects, saw each other's workload, and redistributed work before someone drowned. Nobody assigned it. I built it because we needed it.
- Eliminated the single point of failure in client delivery by building client-specific automations into the proprietary work tool, so any analyst could pick up any project when a teammate was out sick or on vacation.
- Cut project turnaround time 82% and raised workflow efficiency 60% with an automated data pipeline that removed the project-to-analyst bottleneck.
- Ran user research with analysts, prioritized features with engineering, and drove the internal tool to 100% adoption, doing the product manager job before I had the title.

SELECTED PROJECTS

*Full portfolio at james-teeling.com*

**PO Copilot: Agentic AI System for Product Owners *In production at American Airlines***

Python | RAG and vector embeddings | Azure DevOps REST API | SQLite | Human-in-the-loop

Nobody asked for this. Product owners were shipping incomplete stories and rediscovering conflicting business rules in QA, so I built an agentic workflow that turns a rough idea into a Definition-of-Ready-gated work item through conversation, with two-pass retrieval that surfaces conflicting rules and citations mid-draft. Analytics intake dropped from 30 to 45 minutes to about 5. I shipped it with a one-command bootstrap, because a productivity tool that needs a developer to install is a tool most product owners will never adopt. Adopted by all 8 mobile product owners and shared with the CTIO for enterprise rollout.

**AI-Assisted M&A Origination and Research System *Built independently, in daily use at an M&A firm***

Claude Code | Multi-agent orchestration | MCP | Durable data layer

Specialized agents research companies, maintain living client investment theses, generate targeted lists, and score company-to-client fit on a data layer that gives the firm compounding memory. AI drafts; humans decide.

**Full Squish: Mountain Bike Suspension App *Live on the App Store***

React Native | Expo | TypeScript | AI pair programming

Designed, built, and shipped a consumer iOS app solo. Mountain bikers log and recall suspension setups by riding style and trail type, turning setup guesswork into structured experimentation. Version 2 in development. [apps.apple.com/us/app/fullsquish](https://apps.apple.com/us/app/fullsquish)
